

Sediment Acoustics

Real-Time Continuous Suspended Sediment Data in the Lower Columbia River

Sediment Acoustics

Imagine a real-time acoustic sediment network.....

Wood, M.S., 2014, Estimating suspended sediment in rivers using acoustic Doppler meters: U.S. Geological Survey Fact Sheet 2014-3038, 4 p.

Why Real-Time SSC Data is Needed

- Determine sediment loads
- Determine timing of sediment transport
- Define seasonal and event transport mechanisms

Sediment Effects

- Navigation
- Habitat restoration
- Beach restoration
- Reservoir/bay infilling
- Water Quality

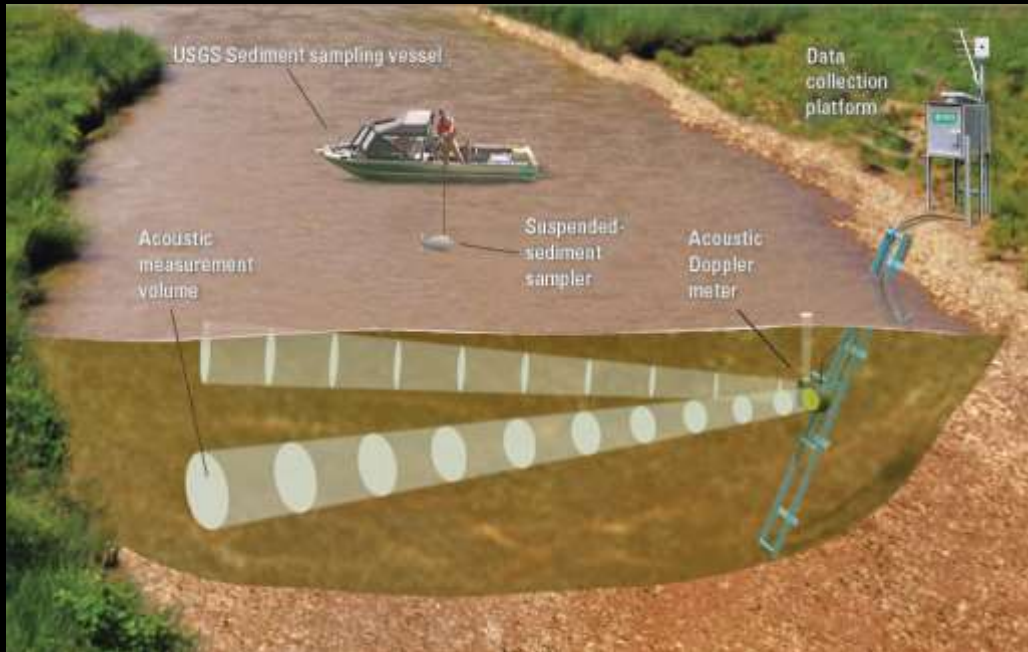

Sediment Acoustics

- ADVM's Deployed at Many Sites to Compute Discharge
- One Instrument, Lots of Uses:
 - Discharge
 - SSC
 - Sediment Flux
 - Velocity
 - Future Applications...
- Limited Instrument Fouling
- Limited Calibration Drift
- Large Measurement/Sample Volume
- Reduced Costs

Sediment Acoustics

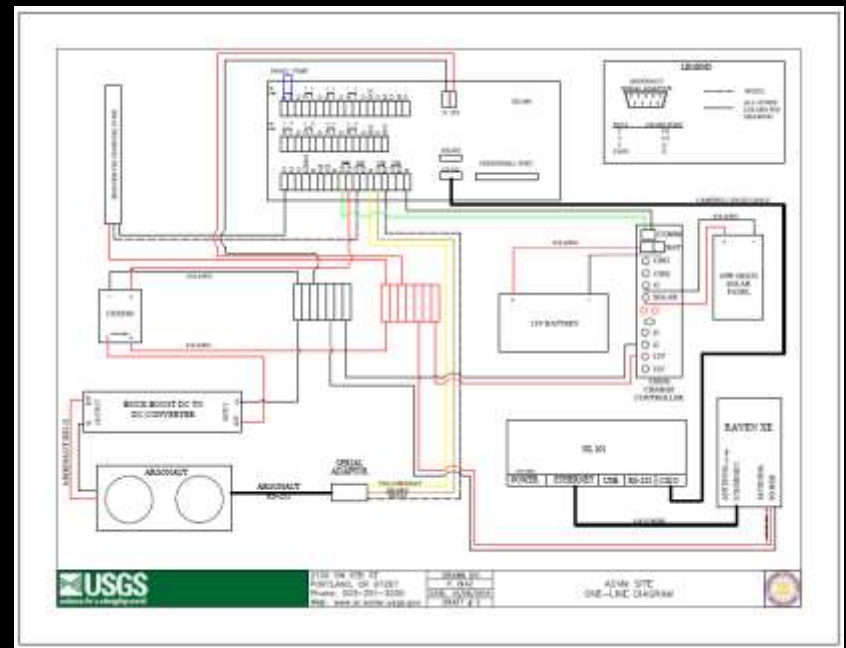

- Transmit acoustic energy of known f (frequency)
- Measure shift in f from return signal to compute velocity
- Acoustic backscatter intensity is measured for QA purposes.

Acoustic Site Instrumentation

- Multi-cell configuration needed to compute SAC (sediment attenuation coefficient).
 - Need LOTS of data transmitted to compute real-time
 - 20 SS values
 - 20 velocity values
 - 15 other
- } Every Measurement Interval
- SDI-12 not sufficient
 - Serial data
 - Two way data communication.
 - 12 volt DC to DC converters used to keep ADVN power constant.

Acoustic Site Instrumentation

Surrogate Acoustics Parameter Processing

- Processing is Done Using SAID (Surrogate Analysis and Index Developer Tool)
 - Acoustic Parameter Processing
 - Raw Measured Acoustic Backscatter needs to be corrected for the effects of:
 - Beam Spreading
 - Water Absorption
 - Normalized Acoustic Parameters
 - SCB (sediment corrected backscatter)
 - SAC (sediment attenuation coefficient)
 - Data Transformations
 - Regression Models

Surrogate Acoustic Parameter Processing

$$WCB = MB + 20\log_{10}(\psi r) + 2r(\alpha_w)$$

$$SCB = WCB + 2r\alpha_s$$

$$SCB = MB + 20\log_{10}(\psi r) + 2r(\alpha_w) + 2r\alpha_s$$

Lower Columbia Acoustic Sites

14144700

Columbia at Vancouver, WA

- Existing NWS tide gage (I-5 bridge)
- NSIP funded in 2015 for discharge
- USACE funding for SSC data.
- Key point for Lower Columbia River (LCR) SSC budget
- New station installed on a USCG dolphin January 2016.
- Data collection commenced in winter 2016.

14211720

Willamette @ Portland, OR

- Site being relocated in spring/summer 2016
- NSIP funded for discharge
- Key point for LCR SSC budget
- Ongoing sediment sampling funded by NAWQA.

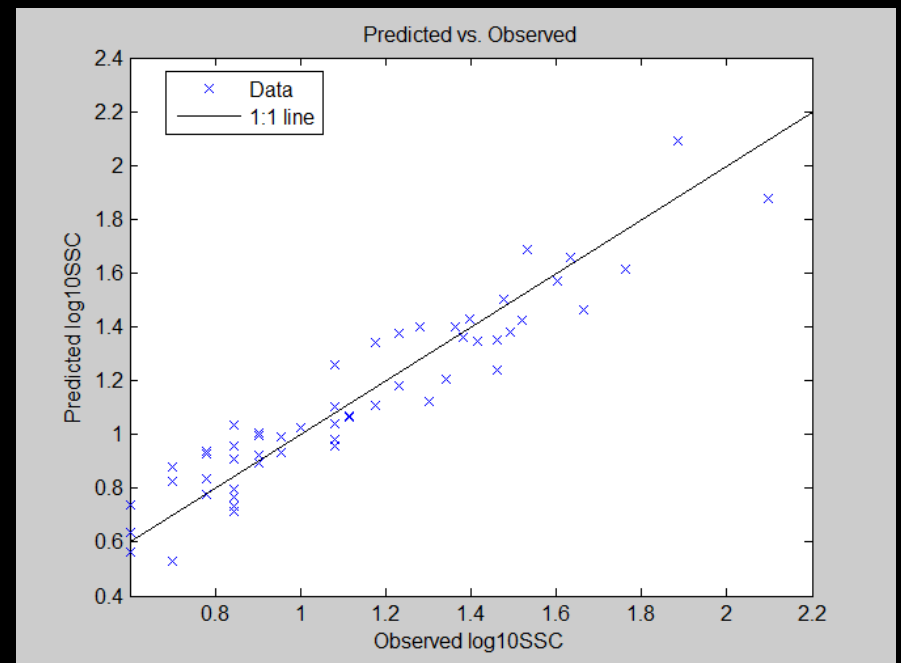

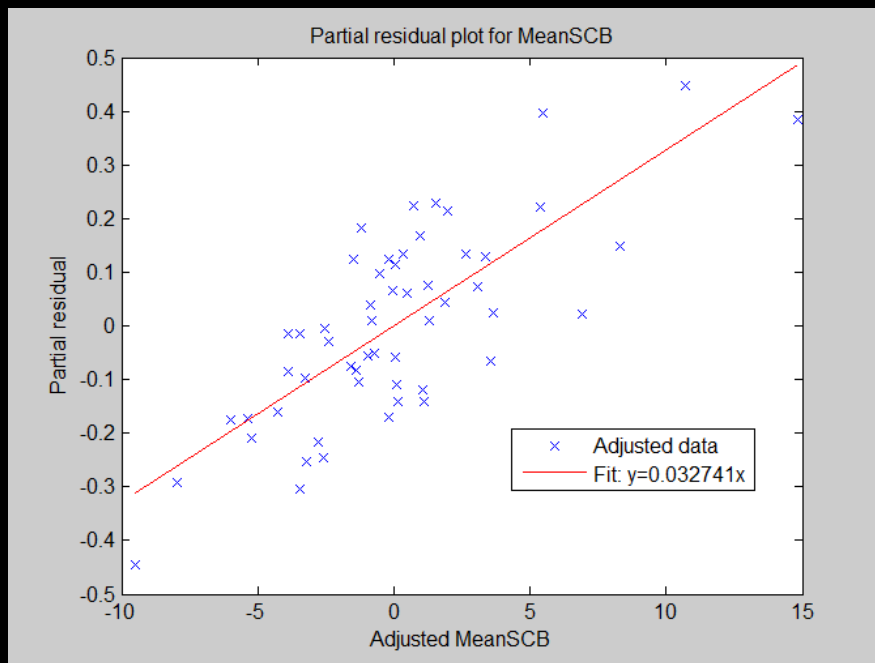

14246900

Columbia River @ Beaver Army Terminal nr Quincy, OR

- Used SAID Model
- Calibration Data - 55 samples collected from WY 2009-2015
- Used Multi-linear Regression to predict SSC
- Predictor Variables Used:
 - SCB (Sediment Corrected Backscatter)
 - Discharge
 - Gage Height
- Model Results .89 R²

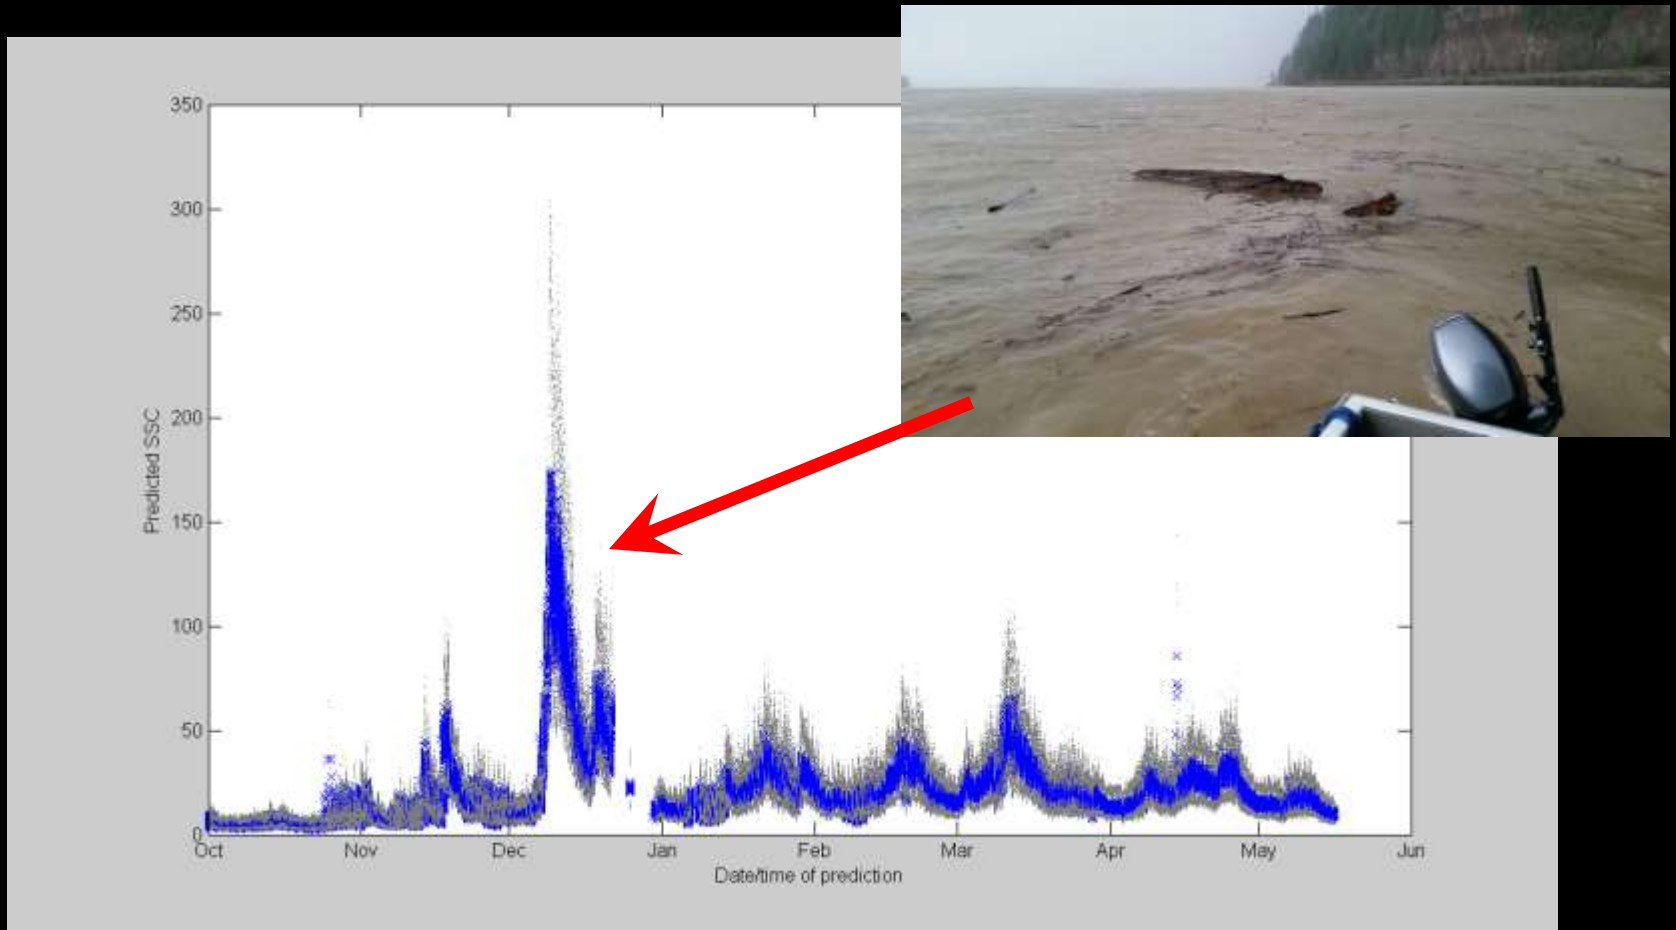

14246900

Columbia BAT Model Results

*Statistics output from SAID model
Provisional, subject to revision.*

Time Series Data (WY 2016)

Next Steps

- Install mechanism to compute real-time SCB from multi-cell backscatter data (Aquarius).
- Real-Time data on NWIS WEB
- Continue collecting SSC verification/calibration samples
- Develop Sediment Acoustic Model for Columbia Vancouver.
- Add additional sites:
 - LCR sites
 - Existing sites
 - Other
